

# \$1.00 Good For \$1.00

TO INTRODUCE  
**The SELF-SETTING PLANE**

(As long as this Ad appears.)

Any dome in this paper is good for one dollar, in payment for a **Self-Setting Plane**, if sent us with the balance of the list price of a Plane from where our Planes are not sold.

If you want more than one Plane and they are not sold in your town we will allow you dealer's discount.

List price of **Beech Wood Planes**: Smother \$3.25, Jack \$3.50, Fore \$3.75 and Jointer \$4.50.

Do not say the price is too high until you try it, then if the Plane is not worth to you, twice its cost, return it at our expense and the trial won't cost you a nickel.

Get one on trial now and let the Plane talk for itself. You run no risk, as this paper guarantees we will do as our advertisement says.

If you don't want a **Self-Setting Plane** now, send us a dome and the addresses of ten carpenter friends, no matter where they live, and we will send you a hard, tough, carpenter's pencil and circulars.

**Gage Tool Co.** VINELAND,  
NEW JERSEY

**THE BEST IS THE CHEAPEST.**

None Cheap but the Best.

All Want the Best.

Sent on 30 Days' Trial as per Circular, if  
Dealers do not keep it.

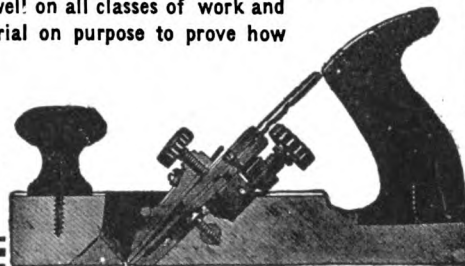

# “GAGE”

## The Self-Setting Plane

Think of the time saved by a plane that sets itself,—and sets exact instantly. We give tangible reasons why the GAGE is the most economical plane for all-around work; here they are: The GAGE is the ONLY plane which sets itself, which has an adjustable iron throat extending through the stock. Which works equally well on all classes of work and wood. We give thirty days' trial on purpose to prove how good it is.

# \$1.00 ON A PLANE FOR A DOME.

The Gage Tool Co., Vineland, N. J., are offering to give our readers \$1.00 credit on any purchase of their planes, where one of the little NATIONAL BUILDER domes is sent in with the order. These domes are a sort of NATIONAL BUILDER trade mark and are to be found at the bottom of every advertising page. The offer made by the Gage Tool Co. in their advertisement in this number is the first of its kind and makes a real bargain. The buyer of a Gage self-setting plane, by simply sending in a little dome, secures a \$1.00 reduction by so doing. The Gage Tool Co. are doing this in order to introduce their well-known planes in new localities and the domes will also tell them which paper the buyer saw the ad. in.

The following description is taken from a circular sent us by the Gage Tool Co.

"The Self-Setting Plane is not like any other plane, having many superior points. It is simple, easier, better. It don't require the "know how" to set it, as other planes do, but can be used by the inexperienced and beginner. It should be in every manual training school, mechanics kit, on every farm, in every home, because all can easily set it and set it right. It is self-setting in every respect; and can be perfectly set for the finest work without trouble. Dropping the plane bit and cap into their place sets it exactly right and does it instantly. When properly adjusted, it's hard to set wrong. The cap and cutter may be removed, replaced and accurately set in five seconds, by actual trial: this alone would save every carpenter many days a year spent in trying to set other planes, and saves the beginner the time to learn how to set them. The adjustment is such that the cutting iron may be set square with the face of the plane, even if the cutting-iron is not ground square with itself. The mouth is prevented from wear by being within the adjustable iron throat or bit-holder which extends through the plane and holds the self-setting device.

"The cap is not attached to the cutter, but remains stationary while the cutter is moved up or down. Even while at work, the thickness of a shaving can be changed by a simple movement of the thumb and finger, without breaking the shaving or stopping the plane. A shaving a foot long can be taken with a dozen changes in thickness, all done without removing the plane from the board and without breaking the shaving. This variation of thickness may be made less than one-thousandth or more than one-hundredth of an inch in one second.

"So accurate is the self-setting device that one can take six or more shavings, removing and resetting the cap and cutting-iron after taking each shaving, and the extreme variation of thickness of the six shavings will be less than four-one-thousandth (.0004) of an inch. Can you do this with any other plane?

"This Self-Setting Plane can be changed from a double to a single iron, or from a single to a double iron plane in two seconds. It is adapted to the coarsest or the finest work, and will smooth cross-grained, eaty, hard or soft wood, against the grain, working perfectly on both hard and soft wood. Every plane is tested, and ready for use before leaving the factory. This saves the time and trouble spent in fixing so many new planes. If you want to save muscle, time, temper, and do better work, try the Self-Setting Plane.

"Old-fashioned wood-planes can be changed to Self-Setting Planes by any mechanic who has our attachments. Such planes having been seasoned for years, make the best tools.

"We send beech-wood self-setting planes, or attachments for remodeling old planes, on trial where not sold by dealers, on receipt of list price. If, after a thorough test on your own bench, you do not want it, or if for any reason you prefer your money, to the plane, return it at our expense, as sent, within thirty days' of receipt, and we will refund the entire amount sent us. And the trial costs you nothing."
